BMS OPERATOR MANUAL

Setting up a new tenant

How a platform administrator registers a company, and how that company's admin finishes branches, staff, products, and customer SMS.

Banking Management System
For cooperatives and microfinance institutions
October 2026

1. Who does what

A tenant is one company on BMS. Each company has its own customers, branches, staff, and settings. Two people set a company up.

Person	Signs in as	Does this
Platform super admin	Platform workspace	Registers the company, chooses products and add-ons, and creates the company admin login.
Company admin	The company workspace	Sets the profile, branches, account numbers, staff, bank products, and SMS.

Use a separate company name and a separate SMS sender for every tenant. Customers of Proto Susu must not receive messages headed Evans Susu.

2. Before you start

- The legal company name, and a short Company ID you will not change later. Example: name **Proto Susu**, ID **proto-susu**.
- Which departments the company paid for: Susu Management, Agency Banking, Loans, Treasury, Investment Management.
- Which add-ons they paid for. SMS is a separate add-on. It does not unlock a department.
- The company admin's full name, email, and a password of at least 8 characters.
- Branch names and short codes.
- A numeric account-number prefix shorter than 12 digits.
- If they want deposit and withdrawal texts: an Arkesel sender name of at most 11 characters, approved on the platform Arkesel account.

3. Register the company

Sign in as the platform super admin. Open **Companies**.

1. Click **+ Register company**.
2. **Company ID.** A short permanent code, such as `proto-susu`. Use letters, numbers, and hyphens. Do not reuse another company's ID.
3. **Company Name.** The name staff and customers should recognise, such as `Proto Susu`.
4. **Subscription.** Leave this on **active**. Inactive companies cannot sign in.
5. **Product modules.** Tick only what this company subscribed to. At least one product is required.
6. **Add-ons.** Tick paid extras now, or add them later with **Edit add-ons**.
7. Click **Register company**. Copy the registration details and keep them with the company file.

Products

Tick this	The company can use
Susu Management	Customers, field agents, coordinators, daily susu, callover, and the susu counter.
Agency Banking	Teller deposits and withdrawals, partner bank products, and back office.
Loans	Loan products, applications, disbursement, and repayments.
Treasury	Cash positions and treasury movements.
Investment Management	Fixed deposits, treasury bills, bonds, and shares.

> A susu-only company sees bank products whose name contains "susu". A banking-only company does not see those susu products. A company with both sees the products for the transaction they are posting.

If a menu says **Product not enabled**, that department was not ticked for this company. SMS does not turn a department on. Open the company row, click **Edit products**, tick the department, and ask the company admin to sign in again.

Add-ons

Add-on	What to tell the company
SMS Notifications	Required before deposit, withdrawal, or daily susu texts can be sent.
Email Notifications	Email alerts for customers who have an email address.
Mobile Money Integration	MoMo collections.
Custom Branding	Logo and colours. The company still fills these in under Company Profile.
Multi-Branch	Extra branch reporting. Create the branches either way.
Bulk Import	CSV or Excel import.
API Access	Keys and webhooks.
Advanced Analytics	Extra dashboards beyond standard reports.

On the company row, **Edit add-ons** changes this list later. The company admin sees **Product Subscription** as read-only. They cannot turn a product or add-on on themselves.

4. Create the company admin

Still on **Companies**, click **+ Create company admin**. You can also use **Add admin** on that company's row if you need a second admin later.

1. Select the company.
2. Enter the admin's full name.
3. Enter the email they will use to sign in.
4. Enter a password of at least 8 characters.
5. Click **Create company admin**.
6. Copy the login panel and send it to the admin on a private channel. It shows the company, company ID, name, email, and password.

> The password is shown once on that success screen. Store it before you close the window.

5. Company admin: first sign-in

The company admin signs in on the BMS sign-in page with the email and password you created. They land in their company workspace, not the platform Companies page.

Work through Settings in this order.

5.1 Company Profile

Open **Settings** → **Company Profile**.

1. Confirm or correct the company name. This name is also used inside customer SMS.
2. Enter the phone, email, address, and tax identification number.
3. Upload a JPEG, PNG, or WebP logo.
4. Choose the brand colour.
5. Click **Save company profile**.

You can open this screen again later, change any field, and save. The sidebar name, logo, and colour update after each save. Removing the logo and saving clears it.

5.2 Branches

Open **Settings** → **Branches**. Add every office the company operates.

1. Enter a short branch code, such as `ACC`.
2. Enter the branch name.
3. Leave the status **active**.
4. Save, and repeat for each branch.

If the company has only one branch, BMS selects that branch automatically on deposit and withdrawal screens. Staff do not see an empty "Select branch" option.

5.3 Account numbers

Open **Settings** → **Account numbers**. Customer account numbers are 12 digits. Type the company's numeric prefix. BMS adds random digits when a registration is approved. The prefix must be shorter

than 12 digits. Save the prefix before the first customer is approved.

5.4 Users and permissions

Open **Settings** → **Users** and create each staff member: tellers, field agents, coordinators, customer service, and back office. Assign the branch they work in.

Open **Settings** → **Roles & Permissions** when a job needs a duty that is not on by default.

- A teller records susu deposits with the teller role.
- To let a teller record a susu withdrawal, tick **Record withdrawals**. Do not use **Open partner bank accounts** for that job.
- After you save a role, that person must sign out and sign in again before the new duty appears.

On a teller deposit, the ledger shows the teller who posted it. It does not add the customer's field agent to that line. Field-collection batches still show the agent.

5.5 Bank products

Create the savings or partner-bank products the counter will post against. Put the word **susu** in the name of every susu deposit product, for example `Susu Savings`. A susu-only company will not see a product that does not contain that word.

6. Customer SMS

Do this only when the SMS Notifications add-on is on the company. One Arkesel account serves the whole platform. Each company still needs its own approved sender name.

6.1 Approve the sender on Arkesel

1. Sign in to the same Arkesel account that already holds the platform API key. Do not create a second Arkesel account.
2. Open **Sender ID**. Do not use **Send Bulk SMS** to register a name. That page only sends a campaign.
3. Request a new sender ID. Use the company's own short name, at most 11 characters, including spaces. `Proto Susu` is 10 characters.
4. Paste a purpose of at least 50 characters, for example: *Proto Susu sends transactional SMS alerts to its customers when a deposit is credited or a withdrawal is debited on their savings account.*
5. Upload the business certificate if Arkesel asks for it.
6. Wait until that exact spelling shows as approved. Approval is per name. Evans Susu does not approve Proto Susu.

> A bulk campaign is not part of setup. It spends SMS credits. Use it only if Arkesel support asks for a portal test.

6.2 Turn SMS on in BMS

Sign in as the company admin. Open **Settings** → **Notification Settings**.

1. Turn on **Enable customer SMS alerts**.
2. Tick **Deposit credited**, **Withdrawal debited**, and **Daily susu collection posted** for the events this company wants.

3. Set **Sender ID** to the approved name, including the space. Example: `Proto Susu`.
4. Click **Save SMS settings**.
5. Enter your own mobile number and click **Send test**.

The test is an API SMS. In the Arkesel log, wait until that row says **DELIVERED**. **SUBMITTING** or **RECHECK** means it is still in progress. **FAILED** means the phone did not get it. Do not keep sending tests. Each test uses a credit. Give Arkesel the message ID and ask why that API SMS failed.

Portal messages and API messages are different. A portal row can be **DELIVERED** while an API row to the same number is **FAILED**. BMS uses the API. The sender must work on API SMS before customers will receive alerts.

6.3 What the customer receives

After a deposit is posted to the ledger, the customer with a valid Ghana number receives a text like this:

> A sum of GHS 50.00 has been credited to your Account # **********4563 being deposited by Ama Mensah - GHS 50.00. current balance is: Ghs 1,250.00

A withdrawal uses “debited” and “withdrawal” in the same sentence. The text is sent only after the transaction is posted. Collecting on the field-agent screen does not send a second message. Daily susu sends one text per customer when the batch is posted.

The customer record must have a Ghana mobile number: `024XXXXXXX`, `23324XXXXXXX`, or 9 digits without the leading zero.

7. Go-live check

1. Company subscription is **active**.
2. Only the paid products and add-ons are ticked.
3. The company admin can sign in and sign out.
4. Company Profile is saved.
5. Every branch exists, and a one-branch company opens with that branch already selected.
6. The account-number prefix is saved.
7. A teller can post a deposit. If they should pay withdrawals, **Record withdrawals** is ticked and they have signed in again.
8. Susu products contain the word susu.
9. The Arkesel sender for this company is approved, saved in Notification Settings, and one API test is **DELIVERED**.
0. Create one test customer with your phone number, post a small deposit, and confirm the credited SMS and the teller’s name on the ledger.

8. If something fails

What you see	What to do
Product not enabled	The department is not on this company's subscription. Edit products as super admin, then sign the company user in again.
Open partner bank accounts requires banking.products.read	You opened the wrong duty. For a susu withdrawal, tick Record withdrawals.
You are not allowed to use this Sender ID	The name in BMS is not approved on Arkesel, or the spelling does not match. Approve that exact name, including spaces.
API SMS FAILED, and the credit was used	BMS handed the message to Arkesel. Ask Arkesel for the network reason and for the sender to be enabled on API SMS. Do not send another test until they reply.
Company profile storage is not ready	Run migration `065_tenant_company_profile.sql` in the Supabase SQL editor, then save the profile again.
SMS settings are missing	SMS Notifications is not on this company's add-ons. Edit add-ons, then sign in again.

9. Example: Proto Susu

Item	Value
Company ID	proto-susu
Company name	Proto Susu
Subscription	active
Products	Susu Management, and Agency Banking only if they paid for the counter
Add-on	SMS Notifications
Sender ID	Proto Susu, approved on the existing Arkesel account
Account prefix	A short number they choose, shorter than 12 digits
First branch	One code and name. It will be selected automatically.

Evans Susu stays on the Evans Susu company only. Proto Susu gets its own admin, its own profile, and its own sender.
